

Acknowledgments

This book has grown out of a course that I first developed in 2003 at Griffith University called the *Foundations of Computing*. The aim of the course was ambitious: to provide a foundational understanding of computing and information technology that encompasses the entire development of Western scientific culture. My first acknowledgements therefore go to my colleagues at the School of Information and Communication Technology for giving me the support and free rein to create a course that goes beyond the normal confines of the information technology degree curriculum. In particular I would like to mention Vladimir Estivill-Castro, who both co-taught and championed the course during his first year as Head of School in 2005, when we went through the challenging process of teaching the material across three campuses.

Secondly, I should like to acknowledge all my past students for their contributions, feedback, suggestions and support and all the other staff who have co-taught the material and contributed to the ongoing success of the course. In this context, David Tuffley has been my most constant and hard-working colleague, and it is due to his willingness to embrace the subject material and take over its delivery on the Brisbane campus, that the course has prospered to the point where a textbook has become feasible.

I have also had considerable help from my Griffith colleagues in reading and criticising the early drafts of this book, including Rodney Topor, Charles Hacker, Patrick Celka, Michael Blumenstein and David Tuffley. I am also grateful to Natalie Crouch at Pearson Education and Rory Kearney for their detailed comments and proof reading of the final document.

The underlying ideas in this book have arisen both as a result of my own life experience and from contact with the works of a few key writers. In particular, I should like to mention the philosophies of Arthur Schopenhauer and Edmund Husserl and the sociological writings of Jacques Ellul and Herbert Marcuse. However, my deepest influence and inspiration has come from the life and works of the Australian author and teacher, Barry Long.

Finally, the writing of this book became a practical possibility because of the support of Griffith University's Academic Study Program, for which I am most grateful, and because my wife Nicolette considered that it would be a worthwhile endeavour. I trust that you, my reader, will agree with her on this.
